WEB TECHNOLOGIES 2026 · BIUH

Your Project

A website of your own — four pages, live, and defended by you.

`webtech.landrock.io`

THE BRIEF · THE WHOLE COURSE

Build a website.
What it is, is up to you.

A portfolio. A site about something you know a lot about. A shop, a tool, a guide, something for your family, your village, your band, your game.

The quote page was the exercise. This is the real thing.

WHAT IT HAS TO BE

Seven requirements — and three images.

Pages	at least four, with working navigation between them
Content	your own words and images, or properly sourced. AI text is edited — and owned — by you
Structure	semantic HTML — what you learned in lessons 2 and 4
Layout	responsive: it works on a phone
Behaviour	at least one thing that responds to the user
Live	reachable at a real address
History	a Git history that shows it grow, week by week
Identity NEW	an **Open Graph image**, a favicon and an app icon

Not required: a server or a database. Nothing may depend on storing data — no logins, no comments, no orders.

WHY YOU CHOOSE

Free choice is not the easy option.

You will care

One month to the presentation, most of it on your own. A subject that is yours keeps you going when the layout breaks at midnight.

It is honest

Everyone builds something different, so the questions are the real ones: why is it built like this?

It is harder

Choosing the size of a project is a skill. Most people choose too big the first time.

Last year's range: portfolios, blogs, landing pages for businesses, guides, small tools. All fine. Boring is fine too — if it is yours.

PART 1 · BRAINSTORM · ALONE · FIVE MINUTES

Five ideas before one good one.

What do you know a lot about?

A game, a sport, a hobby, your hometown, a kind of music, a skill people ask you about.

Who could you build it for?

Your family, a friend's shop, your club, your band, the students who arrive next year.

What is missing?

A guide nobody wrote. A tool you wish existed. A page that exists, but badly.

Write fast, no judging yet. Then open : under **Things I might build**, replace the example ideas with your five. `project.html`

PART 1 · THEN TEST YOUR BEST THREE

Four questions decide it.

ASK	BECAUSE
Who is it for?	"Everyone" is not an answer. A real person is.
What are its four pages?	If you cannot name them, it is not a website yet.
Which page has to be good?	Build that one first.
What is the smallest version worth showing?	Decide now, not in November.

A four-page site done well beats a twelve-page site half-built.

PART 1 · OUT LOUD, THEN WRITTEN DOWN

Sixty seconds each.

1. Tell your neighbour your favourite idea.
2. They ask two things: **who is it for?** and **what are the four pages?**
3. Swap.

Then finish : under **Who each one is for**, one line for each of your five. And for your favourite — a working title, who it is for, and its four pages. `project.html`

Not a final decision. A written starting point — commit it.

PART 2 · THE FIRST PICTURE

Before you write the site, **make its poster.**

One image, 1200 × 630 pixels. It is the first thing anyone will ever see of your project.

PART 2 · WHAT AN OPEN GRAPH IMAGE IS

The picture that appears when you share a link.

- Paste a link into most chat apps or social networks: a **card** appears.
- Title, one sentence, one image — your site chooses all three, in its . `<head>`
- No image? The card is a grey box, or nothing. Nobody clicks a grey box.

"Open Graph" is the name of the standard: a handful of meta tags, started by Facebook in 2010, now read almost everywhere.

PART 2 · WHY IT COMES FIRST

A poster for a site that does not exist yet.

- It forces the first decisions: the **name**, the **one sentence**, the **colours**, the **mood**.
- If you cannot make the poster, you do not know yet what you are building.
- On the course platform it is your project's **cover** — in the gallery, everyone sees it first.
- Make it now. Improve it at the end. Keep both — the difference is part of your story.

Designers call this a mood board. You are making one with exactly one image.

PART 2 · SAME SIZE, THREE MOODS

It should look like your site will feel.

Wenchang Eats

Where the locals eat

A food guide — warm, loud, hungry.

Li Wei

PHOTOGRAPHS · HAINAN

A photo portfolio — quiet, black, let the pictures talk.

PART 2 · THE SPECIFICATION

1200 × 630. Title in the middle.

← 1200 px →

dashed line: keep the words inside it

Size	exactly 1200 × 630 pixels
Format	JPG or PNG
Weight	under 100 KB — export as JPG if it is bigger
On it	the title, big · one line on what it is · one visual
File	`images/og-image.jpg`

Some apps crop the edges, some show it as a small square. A title that hugs the border gets cut off.

PART 2 · GOOD AND BAD

Readable at the size of a thumb.

✓ Do

- A title you can read on a phone
- One strong visual — or just strong colours
- The colours your site will use
- Your own photo or drawing, if you have one

✗ Don't

- Small text, or a paragraph
- A screenshot of an empty page
- A stock photo with no title on it
- Words at the very edge

Test: shrink it to the width of your thumb. Can you still read the title? Then it works.

PART 2 · HOW TO MAKE IT

Any tool that can make a 1200 × 630 canvas.

Figma · **Canva**	free accounts; set a custom size of 1200 × 630
Photopea	free, in the browser, works like Photoshop
Keynote · **PowerPoint**	set the slide size to 1200 × 630, export the slide as an image
HTML and CSS	you are a web developer: build a 1200 × 630 , then DevTools → right-click it → **Capture node screenshot** `<div>`

An AI image generator can help with the picture. The title and the sentence are yours.

The three examples on these slides are plain HTML and CSS — no image editor was involved.

PART 2 · PUTTING IT IN THE HEAD · ONCE THE SITE IS LIVE

Six lines, in every page's . <head>

HTML · in the head

```
<meta property="og:title" content="Wenchang Eats">
<meta property="og:description" content="Where the locals eat — a guide for new students
<meta property="og:image" content="https://YOUR-ADDRESS/images/og-image.jpg">
<meta property="og:url" content="https://YOUR-ADDRESS/">
<meta property="og:type" content="website">
<meta name="twitter:card" content="summary_large_image">
```

- `og:image` needs the **full address**, starting with . A relative path is not enough. `https://`
- Open Graph uses ; the last line uses . Copy them exactly. `property` `name`

Test it: paste your live address into a chat — or into opengraph.xyz. Changed the image and nothing happened? Apps cache previews. Give it time.

PART 3 · ONE IDENTITY, THREE SIZES

The poster, the app icon, the favicon.

`og-image.jpg` · 1200 × 630
the link preview, the cover

`apple-touch-icon.png` · 180 × 180
a phone's home screen

`favicon-32.png` · 32 × 32
the browser tab

Same colours, same letter or mark. Design the icon once at 512 × 512 and export it down — never scale a small image up.

PART 3 · THE ICONS · YOU MET THEM IN LESSON 4

Square, PNG, and two lines in the head.

HTML · in the head

```
<link rel="icon" href="favicon-32.png" sizes="32x32">
<link rel="apple-touch-icon" href="apple-touch-icon.png">
```

- **Square** — 32 × 32 and 180 × 180. Always the same number twice.
- **PNG.** No JPEG: it cannot be transparent, and small JPEGs look smudged.
- **No rounded corners** on the app icon — the phone rounds them itself.
- Readable at 32 pixels means: one letter or one shape. Not your logo with its slogan.

Optional: for Android, as in lesson 4. The two above are required. `favicon-192.png`

PART 4 · THE MONTH AHEAD

From an idea to a defence.

TODAY
five ideas → one · title, who it is for, four pages · the poster, sketched

NEXT SESSION
`og-image.jpg` at 1200 × 630, committed · the scoping talk · layout starts

EVERY WEEK
commits. The history is graded, and it cannot be written afterwards

BEFORE THE END
live at a real address · icons and Open Graph tags in every page · screenshots

LAST SESSION
submitted on the course platform · five minutes to defend it

PART 4 · WHAT YOU HAND IN

Five pieces of text, four images.

Text

- **Title** — three or four words
- **One sentence** — what it is, 10–20 words
- **Description** — 3–5 paragraphs: what, for whom, how you built it
- **Live address** — `https://…`
- **Repository** — public, with your history

Images

- **Open Graph image** — 1200 × 630, under 100 KB
- **Favicon** — 32 × 32 PNG
- **Desktop screenshot** — at least 1200 px wide, no browser bars
- **Phone screenshot** — 375 to 414 px wide

Where: on the course platform. Your login comes before the deadline — until then, all of it lives in your repository. Screenshots without browser bars: DevTools → Ctrl+Shift+P (⌘⇧P) → "Capture screenshot".

PART 4 · HOW IT IS MARKED

PROVISIONAL The shape is settled; the weights still await approval.

WEIGHT	COMPONENT
20%	Process — your Git history
40%	The project — this website
25%	Written exam — reading and diagnosis
15%	Defence — your decisions

The 40%, looked at closely

- **It works** — four pages, links resolve, images load, nothing is placeholder
- **It is yours** — your text, your images, or properly sourced
- **The design fits** its purpose — adequate, not "professional"
- **It works on a phone**

PART 4 · THE DEFENCE

Five minutes. Live. No slides.

- **Three minutes:** open your site at its real address and show it — the page that has to be good first.
- **Two minutes:** questions about your decisions. Why this layout? Why this element? What would you change?
- Start from your project's page on the course platform: the poster, the description, the links.
- Have Live Server ready as a backup, in case the network is not.

Work you cannot explain does not pass — however it was made.

BEFORE YOU LEAVE TODAY

Check all five.

- [ ] `project.html` has your five ideas — no stubs left — and who each one is for
- [ ] Your favourite has a working title, a reader, and four page names
- [ ] The poster is sketched — on paper is fine
- [ ] You know which three images your project needs
- [ ] It is committed and pushed
